Standard Inspection ۲

Among electrical characteristics, total quantity will be inspected as below:

- Distance between emitter and detector
- Current consumption \geq
- ۶ H level output voltage >
- L level output voltage

Testing Method

Distance between emitter and detector specifies maximum distance that output waveform satisfies the standard (FIG-1) under the conditions below against the standard transmitter.

- Measuring place Indoor without extreme reflection of light.
- Ambient light source Detecting surface illumination is 200±50Lux under ordinary white fluorescence lamp of no high frequency lightning.
- c. Standard transmitter

Transmitter wave indicated in FIG-2 of standard transmitter is arranged to satisfy Vo≥50mVp-p under the measuring circuit specified in FIG-3

Precautions for Use

a. Store and use where there is no force causing transformation or change in quality.

b. Store and use where there is no corrosive gas or sea (salt) breeze.

c. Store and use where there is no extreme humidity.

d. Solder the lead pin within the condition of ratings. After soldering, don't add exterior force.

e. Do not wash this device. Wipe the stains of diode side with a soft cloth. You can use the solvent, ethyl alcohol,

or methyl alcohol only.

f. To prevent static electricity damage to the pre-amp, make sure that the human body, the soldering iron are

connected to ground before using.
